

SUSTAINABLE LUXURY AT AFFORDABLE PRICE

With the incessant rise in temperature impacting climate, human life, and ecosystems, it is increasingly dawning on architectural designers and decision-makers to use materials that can reduce heat from the sun, thus mitigating the overall cooling costs of built environments.

Vibrant Technik's sustainable architectural louver configurations from Europe respond with design-led solutions for a multitude of built environment stakeholders.

ARCHITECTURAL LOUVERS
FROM EUROPE

The sleek, extruded exterior grade aluminium alloy 6060 T66 segments convey an effective architectural sentiment.

Grille

As elegant L-shaped sunscreens with exceptional finishes from global suppliers like Akzonobel, the louvers are paired with exteriors for a composition that is quite marvellous, not to mention high-functioning.

Aerofoil

Long spans up to 20 feet aim to serve energy saving in consciously sculpted buildings. Easily app-controlled, the louvers can be customised into fixed as well as movable configurations.

A linear style that strikes balance between aesthetics and solar-shading performance.

S Louvers

Alluring in matt and textured wood and, now, in concrete and marble finishes too, the smooth and curvy S shaped louvers pave the way to a no-see-through.

The unique design adds to the geometric language of the outdoor landscape, providing privacy as well as natural ventilation.

from
conception to
reality.
